Viguier, Gabriel. L'équation de Schrödinger pour un oscillateur harmonique linéaire. Bul. Inst. Politech. Iasi 4 (1949), 226-232. (1 insert)

The article deals with the relationship between the Schrödinger equation for the harmonic oscillator and the Riccati differential equations. In particular, it shows that by suitable transformation the Schrödinger equation for the harmonic oscillator can be transformed into the Riccati type differential equation, and an analogue is found in this context for the quantization in the Schrödinger equation. Equations of Motion of Viscous Fluids With a High Velocity Gradient

7462:

Viguer, G. Les équations du mouvement des fluides visqueux dans le cas de gradients de vitesses élevés. Bul. Inst. Politech. Iași 4 (1949), 203-221. (1 insert)

The author investigates a number of special viscous flows by means of the equations of M. Girault, derived on the hypothesis that the viscous stresses contain not only terms of the first degree in the deformation tensor, but also those of the third degree. From the numerical results shown, it appears that the effects on the third order terms are considerable and, if true, should be observed.

TITLE: Melting-point diagram of the system  $\text{InCl}_3$  -  $\text{TlCl}$

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 8, no. 1, 1963, 253-254

TEXT: Highly hygroscopic indium chloride (melting point  $580^\circ\text{C}$ ) was produced by chlorination of metallic indium and subsequent topping in a chlorine flow. Thallium chloride (melting point  $430^\circ\text{C}$ ) was precipitated from thallium nitrate by means of hydrochloric acid, and then recrystallized from a hot aqueous solution. The system  $\text{InCl}_3$  -  $\text{TlCl}$  was studied by thermal differential analysis with simultaneous visual observation of the crystal formation. Two compounds were found: the incongruently melting  $\text{InCl}_3$  -  $2\text{TlCl}$  with melting point  $350^\circ\text{C}$  and polymorphic conversion at  $320^\circ\text{C}$ , and the congruently melting ( $480^\circ\text{C}$ )  $\text{InCl}_3 \cdot 3\text{TlCl}$ . The system showed two eutectic points at  $260$  and  $390^\circ\text{C}$  corresponding to the compositions with  $48$  and  $6.4$  mole%  $\text{InCl}_3$ , respectively. There are 1 figure and 1 table.

✓ 105. The paper-chromatographic separation of  
uranium (VI). G. Almássy and M. Viggiani (*Magyar  
Kém. Foly.*, 1955, **61** [4], 109-111) 23 Varying  
the pH of the solvent, optimum conditions were  
found for the ascending paper-chromatographic  
separation of  $\leq 3 \mu\text{g}$  of U<sup>VI</sup>. The solvent is  
ether - ethanol - conc. HNO<sub>3</sub> (70:23:7), giving an  
 $R_f$  value of 0.84 on Macherey Nagel 214 paper pre-  
saturated with vapour. Ferric iron gives  $R_f$  0.14,  
other metals even lower values. The spot is de-  
tected with 5 per cent. aq. K<sub>4</sub>Fe(CN)<sub>6</sub>. By com-  
paring the size and the colour of the spot with a  
standard sample, the content of U<sup>VI</sup> ( $< 5 \mu\text{g}$  in  
0.1 ml) can be estimated with  $\pm 20$  per cent.  
accuracy. If Fe<sup>III</sup> is absent, the  $R_f$  is  $< 0.84$ ,  
thus 100  $\mu\text{g}$  of Fe<sup>III</sup> are added to the spot on the  
paper, if necessary. A slightly modified, simple and  
rapid (10 to 15 min.) qual. method is also described  
for quantities of  $\leq 1 \mu\text{g}$ . A. G. PTO

198. Investigations on the fermentative ability of various yeast strains — I. Vigyázs. (*Fizetések Ipar*, Vol. 9, 1955, No. 5, pp. 132-137; 6 figs., 2 tabs.) **HD**

Comparative tests conducted with various yeast strains under plant conditions have proved that the differences in respect to alcohol yield found between the various strains and varieties of examined yeasts were not due in general to the degree of fermentation of the sugar nor to the difference in the propagation ability of the yeasts. Distillery yeasts are the most suitable for the production of spirits from the viewpoint of both rate of fermentation and alcohol yield. Brewery yeast suggested in literature for its ability to ferment raffinose is unsuitable for producing alcohol from molasses since its ability to ferment fructose is limited. Wine yeasts generally yield less alcohol and their rate of fermentation is lower than that of distillery yeasts.

40. Increasing the ergosterol content of baker's yeast - *Sutoipari előiről ergoszterintartalmának növelése - by L. Viggayza* (Food Industry - Élelmiszeripar - Vol. V, No. 5, pp. 151-155, May 1951, 2 figs.)

The Hungarian pharmaceutical industry requires ever increasing quantities of yeast from the distilleries for the production of ergosterol. Yeast produced at present contains small amounts of ergosterol (0.15 to 0.30 per cent) and is, therefore, an expensive initial substance. For increasing the ergosterol content, three series of experiments were made in order to investigate the effect of changes in the composition of nutrients, of variations in pH and of length and vigor of aeration on the ergosterol content of the yeast produced. It was established that in an alkaline medium, in a relatively highly concentrated culture medium, and in the presence of alkali phosphates, the ergosterol content of baker's yeast was increased three-fold provided that a vigorous aeration was applied for 25 to 30 hours subsequently to the alcoholic fermentation. In laboratory experiments the amount of yeast produced under these conditions increased by 55 per cent as compared to the normal yield. With tests performed on a small plant scale in a 30 l fermenting tank, the yeast increase amounted to 100 per cent and the ergosterol content increased to twice its value.

31. Fermentation of the carbohydrates in the roots  
of taraxacum kok-saghyz - Kokszagiz-gyöker szénhid-  
aljainak elerjesztése - L. Vigyázó. (Food Industry -  
Élelmiszer Ipar - Vol. 6, 1952, No. 10, pp. 298-302,  
4 figs., 4 tabs.)

The carbohydrates, insulin and its decomposition products (inulides, fructose) are obtained from roots by means of diffusion or steaming. Accordingly, the fermentation of diffusion liquors and liquors containing carbohydrates obtained by steaming must be treated as separate problems. The carbohydrate content of the liquors is 4 to 6 per cent, expressed in fructose. The inulin contained in the liquors must be subjected to acid hydrolysis since inulin and inulides with a higher degree of polymerization cannot be directly fermented. Hydrolysis was effected by a two-hour treatment at an atmospheric pressure and at pH 3.5, with sulphuric acid. Hydrolysis is not required in the case of steam treated liquors since the nonfermentable carbohydrates are decomposed by the organic acids in the liquor into fermentable inulides during one hour steaming at  $\frac{1}{2}$  at gauge pressure. It is advisable to carry out fermentation at pH 4. The addition of nutritive salts is unnecessary. The yield of the alcohol thus obtained is 58 per cent for reducing substances and 61 per cent for fermentable sugars. L. Vigyázó

Title : On the Effect of the Root Bed on the Seed Qualities  
of the Potato.

Orig Pub: Sb. nauchn. tr. Est. s.-kh. akad., 1957, 3, 46-53.

Abstract: The 1953-1956 experiments of the "Raadi" Experimental Training Farm of the Estonian Agricultural Academy on the Yygovva kollane variety, showed that a decrease in the root bed to 65 x 16.5 cm promotes an increase of 28-35% in the yield, but reduces the average weight of the tubers from 90 to 80-70 g while improving the seed qualities of the tubers.

Title : The Effect of Peat Soils on the Seed Qualities of  
the Potato.

Orig Pub: Sb. nauchn. tr. Est. s.-kh. akad., 1957, 3, 54-62

Abstract: A worsening in the seed qualities of the potato  
was observed on the experimental bases of the  
Estonian Scientific Research Institute of Agri-  
culture and Melioration in Toorn during 1952-1956.  
This process took place under conditions where there  
was a slight drying of the soils with insufficient  
application of phosphorus and potassium fertilizers.

TITLE: Generator of  $0\text{-}360^\circ$  continually variable phase shift

PERIODICAL: Tehnika, no. 4, 1962, 720-726

TEXT: The article describes a phase shift generator in which linear potentiometers are used for continuous phase shifting of sinusoidal 50-c voltage. The M2 potentiometer of the CHMAG Firm and the ST,901 CL 100P, PU of the Beckman Firm are examples of potentiometers used for this purpose. To obtain the desired proportionality between the phase shift and the rotation of the mechanical shaft, a transistorized instrument, whose diagram is shown in Fig. 7 was built. The phase rotor OF gives a  $90^\circ$  shifted current in relation to the current passing to the emitter follower EF1 producing on emitter followers EF1 and EF2 a tension of  $0^\circ$  and  $90^\circ$  respectively. At the collectors EF1 and EF2, the tension is shifted for a further  $180^\circ$  producing on emitter followers EF3 and EF4 a tension of

Y/C01/62/000/004/002/002  
D261/D303

Generator of 0-360°...

180° and 270° respectively. From EF1, EF2, EF3 and EF4, the tension of 90, 180, 270 and 360° phase is passed to the potentiometer with a 360° continuous winding. By the rotation of the potentiometer shaft, a tension is obtained on the slider, whose phase relation depends on the angle position of the potentiometer slider, but whose amplitude is changeable. To reduce these amplitude changes, the potentiometer slider KP1 is connected to R51 with a high input impedance. The signal passes from R51 to the amplitude compensator AK, whose collector circuit contains the potentiometer KP2 with a 360° continuous winding. The transistor T9 represents an emitter follower with a high input impedance. Transistors T10, T11 and T12 represent an amplifier, whose selectivity is achieved with negative reaction from the output of T12 to input of T10 by means of a double filter T with RC elements, and transistor T13 ensures a low output impedance. The phase shift generator has on the front panel a phase shift button, connections for the input, output and for a 9-v power supply. The 0-360° calibrated phase shift button is connected to the potentiometer shaft KP1 and KP2 thus ensuring the desired linearity. The generator is equipped with printed circuit and the phase displacement ranges from

Y/001/62/000/004/002/002

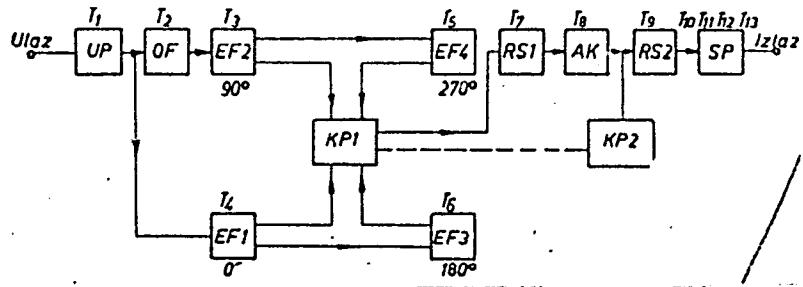

D261/D303

$+4^\circ$  to  $-5^\circ$ . A better performance could not be achieved due to the lack of instruments for regulating the phase relation on the emitters of transistors T3, T4, T5 and T6. There are 3 tables, 12 figures and 3 non-Soviet bloc references. The references to the English-language publications read as follows: Chance, Hughes, Mac Nichol, Sayre, Williams: Waveforms, book 19 of the MIT series; Blackburn: Components Handbook, book 17 of the MIT series; Landee, Davis, Albrecht: Electronic designers handbook.

TITLE: Slit-type camera device for X-ray equipment

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,  
no. 7, 1962, abstract 7-5-32 (Czech. pat. cl. 30 a,  
6/06, no. 97957, Jan. 15, 1961)

TEXT: It is proposed to improve the quality of X-ray photographs by eliminating scattered radiation using two diaphragms, the first of which is placed between the source and the irradiated body and the second between that and the film. The first diaphragm cuts a flat beam out of the radiation flow of the source, which then passes through the object investigated and is registered on the film. The second diaphragm is placed between the object and the film in such a manner that it does not further restrict the beam but protects the film to a certain extent from scattered radiation. During operation, both diaphragms (which are connected by an arm) are rotated about an axis passing through the source of radiation, so that the whole object is eventually irradiated. The resulting inten-

S/194/62/000/007/084/160  
D295/D308

sity of scattered radiation is proportional solely to the cross-section of the flat beam. The relative decrease of useful exposure due to limitation of the beam must be compensated by a corresponding increase of intensity of the source, but neither the object nor the operator are subject to this radiation. The radiation of most X-ray apparatus pulsates at the mains frequency and, to avoid nonuniform blackening of the film due to the stroboscopic effect, both the slit width for a given photograph format and the exposure, must be determined.
